

## Press Release

Date: December 14, 2004

Subject: Snow Removal

In an effort to continually improve Worksmart, Inc. customer service and superior subsurface imaging procedures, we are pleased to announce the addition of site snow plowing.

Winter time in the mid-west adds many weather related challenges to providing our customers with reliable ground penetrating radar data. One of those is snow covered sites. Even though our Ground Penetrating Radar equipment will scan through snow cover, deeper snow will hinder the contact between the surface and the radar antenna possible degrading the data quality.

Snow plowing will now be an option on an as needed basis.
